# ***Create and Attach Piping***

## **Create Piping:**

Fold fabric around cord

Stitch to secure

## **Attach to Panel:**

Pin piping to panel

Snip corners if needed

Stitch to attach

Attach adjoining panel

Re-stitch from other side

**#003-2**

# ***Create and Attach Piping***

**Attach to Base:**

Trim end of cord

Fold fabric over

Pin around base

Snip corners if needed

Overlap and cut off excess

Tuck end into fold

Pin in place

Stitch to secure

# Quick Reference Sheet: How to Create and Attach Piping

For information on how to prepare bias strips, see the 'Cut and Join Bias Strips' quick reference sheet.

Fold your piping in half around your cotton cord, **wrong** sides together, matching the long raw edges of the bias together. Pin to secure **(1)**.

Using the zipper or piping foot on your sewing machine and the needle moved all the way to one side, baste along the entire length of your bias to encase the cord **(2)**. Run the cord loosely along the edge of the zipper foot to ensure it's nicely secured within the bias strip using a slightly longer stitch length (i.e. 4mm).

There are two situations in which you will install piping. They are broken down into two different sections below.

## TO ATTACH PIPING TO A PANEL:

Begin by pinning the end of the piping to one outer corner, matching raw edges **(1)**. Continue to pin the piping all the way around the outer edge of the panel. If you need to make a few small snips in the bias to help it turn around the corners more easily, snip no more than  $\frac{1}{4}$ " (0.6cm) in from the raw edge of the **bias only** (based on a  $\frac{1}{2}$ " (1.3cm) seam allowance) **(2)**.

Using a thread that matches your piping, stitch around the outer edge of your panel as close as you can to the cord, to ensure it's firmly held within the bias strip **(3)** and then trim any excess piping off the ends of your panel.

**NOTE:** be fussy! This row of stitching is where the final seam will ultimately be, so unpick sections if necessary to stitch again so you get it as perfect as possible. It also helps to use a coordinating thread so if any stitches show once the bag is constructed, they are almost invisible.

Take your adjoining panel and place it right sides together with the panel you attached your piping to, matching raw edges. Using a different coloured thread, stitch to join, stitching close to the piping **(4)** (you may be able to feel it underneath the adjoining panel). Don't worry too much about getting right up next to the piping as that comes in the next step. This is essentially a basting step, however use a normal stitch length. **NOTE:** you will be stitching this seam again in the next step, so it makes it easier if you use a different coloured thread to the thread you used to attach your piping.

Turn your panels over so you are looking at the wrong side of the panel you attached the piping to. There's a good chance your two rows of stitching will NOT be overlapping – that is ok! Re-thread your machine with your first thread colour and stitch around the outer edge again, **directly over top** of the first row of stitching you made (**dashed line**) (5).

Your piping is now attached securely between your two panels.

#### TO ATTACH PIPING TO A BASE:

Unpick 2½" (6.4cm) at one end of your piping and cut 2" (5cm) off the cord (6).

Fold the fabric over 1" (2.5cm) to the wrong side and finger press (7).

Pin the end of the piping along the **back edge** of your base, matching raw edges (8). Continue to pin the piping all the way around the outer edge of the base. If you need to make a few small snips in the bias strip as you go around the corners, snip no more than ¼" (0.6cm) in from the raw edge of the **bias strip only** (based on a ½" (1.3cm) seam allowance) (9).

When you get back to the start, overlap your piping and make a small mark on your fabric where the beginning of the cord starts (10). Cut the excess piping off at this mark.

Open up the start of your bias strip and tuck the end you've cut into the fold – the two ends of the cord should meet together (11). Re-fold the bias strip and pin to hold in place (12). Using a thread that matches your piping, stitch all the way around to secure (13).

**NOTE:** be fussy! This row of stitching is where the final seam will ultimately be, so unpick sections if necessary to stitch again so you get it as perfect as possible. It also helps to use a thread that coordinates with the bias strip so if any stitches show once the bag is constructed, they are almost invisible.

Repeat diagrams 4 and 5 from "To Attach Piping to a Panel" to attach the base to its adjoining panels.
