# ***Create a Double Pull Zipper***

Collect zippers and  
pliers or skewer

Remove top zipper  
stops

Remove one zipper pull

Rotate removed pull

Feed pull onto one side  
of second zipper

Feed second side in

Wriggle pull onto  
zipper tape

Move pull towards  
existing pull

Check alignment of  
teeth

## Quick Reference Sheet: How to Create a Double Pull Zipper

To make a double pull zipper you will need two identical zippers (they can be different colours though) and a pair of pliers or a metal skewer (1).

Remove the top zipper stops off **both** zippers (2). These are the small metal 'claws' at the top/open end of the zipper on each side.

Take the zipper pull off one of the zippers and put the zipper tape aside as it won't be needed (3).

Rotate the zipper pull 180° and move the zipper pull on the second zipper down a few inches so it is out of the way (4).

Feed the end of one side of the zipper tape into the zipper until the pull is sitting at the start of the zipper teeth (5).

Ensure the loose zipper pull is facing the opposite direction to the pull on the second zipper – both should be facing each other with the **rounded ends facing in** and the flat ends facing out.

Holding the pull and tape in place, feed the second side of the tape into the pull until the pull is sitting at the start of the teeth and the two ends of the tape are level with each other **(6)**.

Holding the ends of the tape firmly in place together and level with each other, gently wriggle the zipper pull down and onto the teeth to create your double pull zipper **(7 & 8)**.

If your zipper tape looks uneven and is not sitting flat when the zipper pulls are closed together, you can check if the teeth have been fed through the second pull correctly by looking at the teeth at the very start of the tape.

There should only be **one** tooth sitting past the last tooth on the opposite side.

If there is more than one tooth, take your added zipper pull off and have another go at feeding it on evenly **(9)**.
